Moore, Randy, and Mark D. Decker. **More than Darwin: An Encyclopedia of the People and Places of the Evolution-Creationism Controversy.** Westport, Conn., Greenwood Press, 2008. 415p. illus. maps. index. \$85.00. ISBN 13: 978-0-313-34155-7.

Although there are many books that discuss the theories of evolution and creationism, this 415-page encyclopedia is unique in emphasizing the people and places that have played an important role in the evolution-creationism debate over the years. Over 500 scientists, religious leaders, organizations, and locations are discussed. Access to the main part of the text is alphabetical by entry, although a detailed index is provided. Entries range from as few as 30 words to over 6 pages, with mid-length to longer descriptions being more common. Less familiar individuals or places are present, but only if they played an important role in the evolution-creationism controversy. Entries are well written, descriptive, and take an objective tone. Text predominates, although approximately 80 illustrations are included, consisting primarily of photographs of key individuals or places. More illustrations would be preferable, but space constraints likely limited their inclusion in this single-volume encyclopedia. References are occasionally provided at the end of an entry, but there is an extensive bibliography of 160-plus references at the end of the book. The references serve to provide additional reading on a topic or entry and for the most part do not attempt to document primary literature. An appendix provides a brief guide to the sites of the Scopes Trial, but in this reviewer's opinion, it does not provide much value. Overall, this book meets its stated goals and is recommended for a general audience through first-year college students.—**Kevin McDonough**
